

1. Introduction

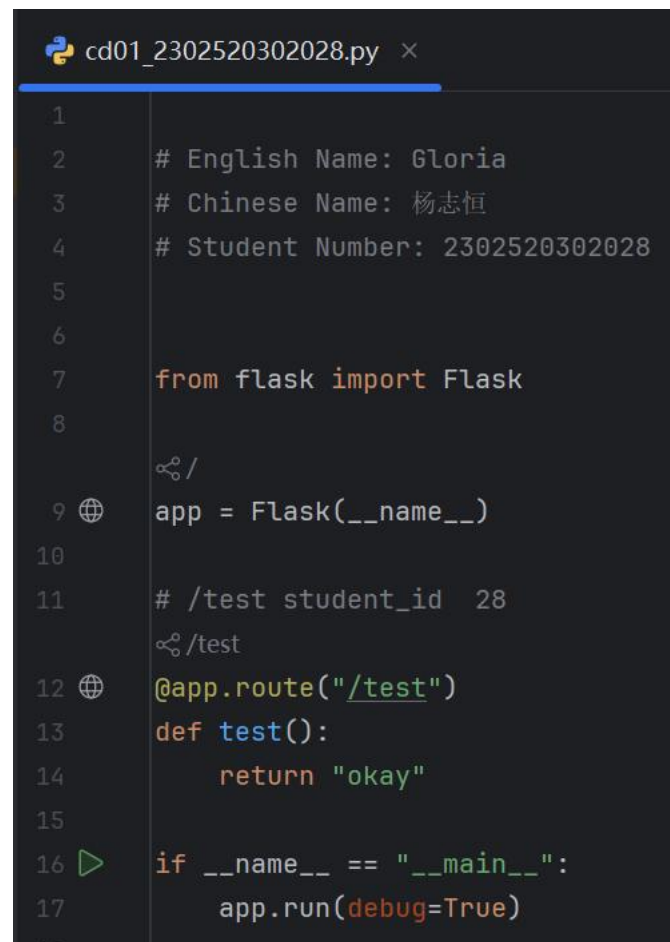

Chinese name: 杨志恒

English name: Gloria

ID: 2302520302028

```
C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

2. Setup the Flask App

A screenshot of a code editor window titled 'cd01_2302520302028.py'. The code is written in Python and sets up a Flask application. It includes comments for the English name (Gloria), Chinese name (杨志恒), and student number (2302520302028). The application has a single route '/test' that returns 'okay'. The Flask app is named 'app' and is run in debug mode.

```
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6
7 from flask import Flask
8
9
10
11 # /test student_id 28
12 @app.route("/test")
13 def test():
14     return "okay"
15
16 if __name__ == "__main__":
17     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X GET http://127.0.0.1:5000/test
okay
C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

3. /radius

3.1 Here I test the Planets API endpoint with curl.

```
C:\Users\OMEN>curl -X GET "https://stevec.pythonanywhere.com/planets/surface-area/earth?units=miles"
{"area": 196.89, "name": "earth"}
C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

3.2 These screenshots show successfully calling the `/planets/surface-area` from my Flask app, and using curl to call my `/radius` endpoint, without changing the information.

```
cd01_2302520302028.py x
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6 import requests
7 import math
8 from flask import Flask, request, jsonify
9
10
11 app = Flask(__name__)
12
13 @app.route('/radius', methods=['POST'])
14 def get_radius():
15     data = request.get_json()
16     planet = data.get("planet")
17     response = requests.get(f"https://stevec.pythonanywhere.com/planets/surface-area/{planet}?units=miles")
18     result = response.json()
19     return result
20
21 if __name__ == "__main__":
22     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X POST "http://127.0.0.1:5000/radius" -H "Content-Type: application/json" -d '{"planet": "earth"}'
{"area": 196.89, "name": "earth"}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

3.3 Here I've added code to calculate the radius from the surface-area, and tested it using curl.

```
cd01_2302520302028.py x
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6 import requests
7 import math
8 from flask import Flask, request, jsonify
9
10
11 app = Flask(__name__)
12
13 # /radius "miles (post)"
14 @app.route(rule: "/radius", methods=["POST"])
15 def radius():
16     planet = request.get_json()["planet"]
17     url = f"https://stevec.pythonanywhere.com/planets/surface-area/{planet}?units=miles"
18     area = requests.get(url).json()["area"]
19     radius = math.sqrt(area * 1000000 / (4 * math.pi))
20     return jsonify({"planet": planet, "radius": radius, "units": "miles"})
21
22 if __name__ == "__main__":
23     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X POST http://127.0.0.1:5000/radius -H "Content-Type: application/json" -d '{"planet": "earth"}'
{
  "planet": "earth",
  "radius": 3958.283513428723,
  "units": "miles"
}
C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

4. /distance

4.1 Here I test the Planets API endpoint with curl.

```
C:\Users\OMEN>curl -X POST "https://stevec.pythonanywhere.com/planets/average-distance/earth" -H "Content-Type: application/json" -d '{"units": "miles"}'
{"distance": 92.96, "name": "earth", "units": "miles"}
C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

4.2 These screenshots show successfully calling the `/planets/average-distance` from my Flask app, and using curl to call my `/radius` endpoint, without changing the information.

```
cd01_2302520302028.py x
1
2  # English Name: Gloria
3  # Chinese Name: 杨志恒
4  # Student Number: 2302520302028
5
6  import requests
7  import math
8  from flask import Flask, request, jsonify
9
10
11  app = Flask(__name__)
12
13  @app.route("/distance/<planet>", methods=["GET"])
14  def distance(planet):
15      url = f"https://stevec.pythonanywhere.com/planets/average-distance/{planet}"
16      distance_response = requests.post(url, json={"units": "miles"})
17      return distance_response.json()
18
19  if __name__ == "__main__":
20      app.run(debug=True)
```

```
C:\Users\OMEN>curl -X GET http://127.0.0.1:5000/distance/earth
{
  "distance": 92.96,
  "name": "earth",
  "units": "miles"
}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance":"miles (route)","radius":"miles (post)","student_id":28,"tilt":"degrees (query)"}
```

4.3 Here I've added code to calculate the distance from the average-distance, and tested it using curl.

```
cd01_2302520302028.py x
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6 import requests
7 import math
8 from flask import Flask, request, jsonify
9
10
11 app = Flask(__name__)
12
13 # /distance "miles (route)"
14 @app.route(rule="/distance/<planet>", methods=["GET"])
15 def distance(planet):
16     url = f"https://stevec.pythonanywhere.com/planets/average-distance/{planet}"
17     distance = requests.post(url, json={"units": "miles"}).json()["distance"]
18     distance_av = distance / 92.9558
19     return jsonify({"planet": planet, "distance": distance_av, "units": "AU"})
20
21 if __name__ == "__main__":
22     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X GET http://127.0.0.1:5000/distance/earth
{
  "distance": 1.0000451827642816,
  "planet": "earth",
  "units": "AU"
}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance":"miles (route)","radius":"miles (post)","student_id":28,"tilt":"degrees (query)"}
```

5. /tilt

5.1 Here I test the Planets API endpoint with curl.

```
C:\Users\OMEN>curl -X POST "https://stevec.pythonanywhere.com/planets/axial-tilt/earth" -H "Content-Type: application/json" -d '{"units": "degrees"}'
{"name": "earth", "tilt": 23.44, "units": "degrees"}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

5.2 These screenshots show successfully calling the `/planets/axial-tilt` from my Flask app, and using curl to call my `/radius` endpoint, without changing the information.

```
cd01_2302520302028.py x
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6 import requests
7 import math
8 from flask import Flask, request, jsonify
9
10
11 app = Flask(__name__)
12
13
14 @app.route("/tilt", methods=["GET"])
15 def tilt():
16     planet = request.args.get("planet", None)
17     url = f"https://stevec.pythonanywhere.com/planets/axial-tilt/{planet}"
18     tilt_response = requests.post(url, json={"units": "degrees"})
19     return tilt_response.json()
20
21 if __name__ == "__main__":
22     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X GET "http://127.0.0.1:5000/tilt?planet=earth"
{
  "name": "earth",
  "tilt": 23.44,
  "units": "degrees"
}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance":"miles (route)","radius":"miles (post)","student_id":28,"tilt":"degrees (query)"}
```

5.3 Here I've added code to calculate the tilt from the axial-tilt, and tested it using curl.

```
cd01_2302520302028.py x
1
2 # English Name: Gloria
3 # Chinese Name: 杨志恒
4 # Student Number: 2302520302028
5
6 import requests
7 import math
8 from flask import Flask, request, jsonify
9
10
11 app = Flask(__name__)
12
13 # /tilt "degrees (query)"
14 @app.route(rule: "/tilt", methods=["GET"])
15 def tilt():
16     planet = request.args.get("planet", None)
17     url = f"https://stevec.pythonanywhere.com/planets/axial-tilt/{planet}"
18     degrees = requests.post(url, json={"units": "degrees"}).json()["tilt"]
19     radians = degrees * (math.pi / 180)
20     return jsonify({"planet": planet, "tilt": radians, "units": "radians"})
21
22 if __name__ == "__main__":
23     app.run(debug=True)
```

```
C:\Users\OMEN>curl -X GET "http://127.0.0.1:5000/tilt?planet=earth"
{"planet": "earth", "tilt": 0.40910517666747087, "units": "radians"}

C:\Users\OMEN>curl -X GET https://stevec.pythonanywhere.com/planets/assignment/28
{"distance": "miles (route)", "radius": "miles (post)", "student_id": 28, "tilt": "degrees (query)"}
```

6. Deploy to PythonAnywhere

My username is sanqiqi7, so my app is deployed to <https://sanqiqi7.pythonanywhere.com/>

6.1 /radius

curl -X POST https://sanqiqi7.pythonanywhere.com/radius -H "Content-Type: application/json" -d '{"planet": "earth"}'

```
C:\Users\OMEN>curl -X POST https://sanqiqi7.pythonanywhere.com/radius -H "Content-Type: application/json" -d '{"planet": "earth"}'
{"planet": "earth", "radius": 3958.283513428723, "units": "miles"}
```

6.2 /distance

curl -X GET <https://sanqiqi7.pythonanywhere.com/distance/earth>

```
C:\Users\OMEN>curl -X GET https://sanqiqi7.pythonanywhere.com/distance/earth
{"distance": 1.0000451827642816, "planet": "earth", "units": "AU"}
```

6.3 /tilt

`curl -X GET "https://sanqiqi7.pythonanywhere.com/tilt?planet=earth"`

```
C:\Users\OMEN>curl -X GET "https://sanqiqi7.pythonanywhere.com/tilt?planet=earth"
{"planet":"earth","tilt":0.40910517666747087,"units":"radians"}
```
